METHODOLOGY AND SYSTEM DESCRIPTION

Legal IT Maturity Assessment

Methodology, structure, scoring model, and AI-assisted review layer

Prepared as a technical and methodological description of the assessment instrument and associated software workflow. This document is intended to support an intellectual-property and copyright filing by describing the original selection, arrangement, wording, scoring logic, user experience, and AI-assisted review design embodied in the work.

IMPORTANT SCOPE STATEMENT

This document describes the assessment method and software design. It is not a legal opinion, certification, audit report, or claim that an assessed organization complies with any particular law, regulation, or framework.

Version 1.0 | 23 October 2026

Confidential working document for submission preparation

1. Executive description

The Legal IT Maturity Assessment is a structured self-assessment and decision-support instrument for organizations that depend on technology to deliver legal, regulatory, professional, and business services. It translates qualitative operating conditions into a consistent five-level maturity view across eight related IT management domains.

The work combines: (1) a domain taxonomy, (2) a cross-domain capability model, (3) behavioral descriptions for five maturity levels, (4) a repeatable scoring and aggregation method, (5) visual reporting and roadmap interpretation, and (6) an optional AI-assisted review layer that examines the submitted scores and written context without replacing human judgment.

Intended use

- Create a common language for discussing the current state of legal IT operations.
- Identify uneven capability, material gaps, and priority areas for improvement.
- Support structured conversations among legal leadership, IT, risk, compliance, security, and operational stakeholders.
- Provide a repeatable baseline that can be reassessed over time.
- Produce an explainable, reviewable output rather than an opaque numerical ranking.

Design principles

- Evidence-aware: scores represent the respondent's stated position and should be supported by organizational evidence in a formal engagement.
- Dimension-balanced: maturity is assessed across people, process, tooling, data, and continual improvement rather than technology alone.
- Comparable: every domain uses the same five dimensions and five-level scale.
- Action-oriented: results are connected to recommended roadmap phases and review prompts.
- Human-accountable: AI observations remain advisory and cannot silently change scores or certify compliance.

2. Assessment structure

The assessment is organized as a matrix. Each domain is evaluated against five dimensions. Each dimension is scored on a 1-to-5 ordinal scale using descriptions and examples associated with the selected maturity level.

Structural element	Description
Domains	Eight areas of legal IT operating capability.
Dimensions	Five cross-cutting capability dimensions applied consistently to every domain.
Maturity levels	Five ordered states from Initial to Optimized.
Questions / indicators	Prompts that help a respondent select the level that best represents current practice.
Written context	Optional summary context used to explain the score and, when enabled, support AI-assisted review.
Outputs	Domain averages, overall average, maturity labels, comparative views, and improvement roadmap interpretation.

The eight domains

IT Service Management
How IT services are managed and delivered.

Risk and Compliance
How risks are managed and compliance obligations are addressed.

Cybersecurity
How the organization is protected against cyber threats.

Incident and Problem Management
How incidents are resolved and recurring problems are addressed.

Business Continuity and Resilience
How the organization prepares for and recovers from disruption.

Knowledge and Data Management
How knowledge, information, and data are governed and used.

Change and Deployment Management
How changes are planned, authorized, tested, and deployed.

Infrastructure and Tooling
How infrastructure and enabling technology are managed and improved.

3. Cross-cutting capability dimensions

The five dimensions are deliberately reused across all domains. This creates a consistent analytical frame and prevents an assessment from treating a documented process or a purchased tool as proof of mature capability by itself.

People & Organization

Roles, responsibilities, skills, capacity, leadership, ownership, and organizational alignment.

Process

Defined procedures, workflows, controls, consistency, ownership, governance, and operational execution.

Tooling

Systems, automation, integration, technical enablement, reliability, and appropriateness of tools.

Data

Data quality, ownership, classification, availability, reporting, metrics, and use of information for decisions.

Continual Improvement

Measurement, review cadence, lessons learned, corrective action, experimentation, and adaptation.

WHY THE MATRIX MATTERS

A domain can have sophisticated technology but weak ownership, inconsistent processes, or limited improvement discipline. The matrix makes those differences visible and supports a more defensible conversation about maturity.

4. Maturity scale

Each dimension uses a five-level maturity scale. The levels are ordered states, not percentage grades. A respondent selects the description that most closely reflects the organization's current and repeatable operating reality.

Level	Meaning and characteristic pattern
1 | Initial	Ad hoc, reactive, dependent on individuals, and generally undocumented. Outcomes vary and there is limited repeatability.
2 | Developing	Basic roles or practices exist, but execution is inconsistent, localized, or only partially documented.
3 | Established	Practices are documented, owned, and generally implemented across the relevant area with defined governance.
4 | Managed	Performance is measured and controlled. Management uses metrics, reviews, and evidence to manage variation and risk.
5 | Optimized	Capability is continuously improved, integrated, adaptive, and informed by benchmarking, insight, and forward planning.

Level interpretation

- Initial does not mean that nothing exists; it means the capability is primarily informal or reactive.
- Established represents a stable baseline, not perfection or regulatory compliance.
- Managed indicates evidence-based control and measurement, not merely the existence of a policy.
- Optimized indicates a sustained improvement system, not a one-time transformation project.

5. Scoring and aggregation method

The scoring model is intentionally simple and transparent. Its purpose is to structure judgment, not to create false precision.

Dimension scoring

For each domain, the respondent assigns a whole-number score from 1 through 5 for each of the five dimensions. The system stores the five dimension scores as the domain record. Optional written context can be captured separately and does not automatically alter the numeric score.

Domain average

The domain score is the arithmetic mean of the completed dimension scores for that domain:

FORMULA

Domain score = (People + Process + Tooling + Data + Continual Improvement) / number of completed dimensions

The implementation calculates a domain average from the available completed dimensions. A domain with no positive score is treated as unassessed for overall aggregation.

Overall average

The overall score is the arithmetic mean of the assessed domain averages. Unassessed domains are excluded rather than treated as zero, so the result reflects the domains actually completed:

FORMULA

Overall score = sum of assessed domain averages / number of assessed domains

Maturity label thresholds

Score interval	Displayed maturity label
Below 2.0	Initial
2.0 to below 3.0	Developing
3.0 to below 4.0	Established
4.0 to below 4.5	Managed
4.5 to 5.0	Optimized

The thresholds are applied consistently to domain and overall averages. The label is a communication aid and should be interpreted alongside the dimension-level pattern, written context, and evidence review.

6. Assessment workflow

Stage	Method description
1. Orient	The user reviews the purpose, scope, confidentiality guidance, and the meaning of the maturity scale.
2. Select domain	The user works through the eight domains in a guided sequence or returns to a domain for review.
3. Score dimensions	The user evaluates People & Organization, Process, Tooling, Data, and Continual Improvement for the selected domain.
4. Add context	The user may provide a concise, non-sensitive explanation of the score, known constraints, or supporting operating context.
5. Review completeness	The system validates score ranges and identifies domains or dimensions that remain incomplete.
6. Calculate results	The system calculates domain averages, the overall average, maturity labels, and comparative views.
7. Interpret	The user reviews strengths, gaps, and roadmap implications without treating the output as a certification.
8. Optional AI review	Selected domains can be reviewed by a governed AI service using only scores and supplied context.
9. Human validation	A qualified reviewer accepts, requests evidence for, or overrides AI-generated observations and recommendations.
10. Reassess	The assessment can be repeated at a later date to compare progress and refresh priorities.

7. AI-assisted review methodology

The AI feature is an assistive review layer. It is designed to help identify review questions and plausible improvement priorities from the assessment inputs. It does not replace a human-led assessment, does not determine the organization's score, and does not provide legal advice or a compliance certification.

Inputs

- The domain identifier and domain description.
- The five dimension scores for the domain.
- The calculated domain average and maturity label.
- Optional written context supplied by the user, subject to length and safety validation.

Review behavior

- The AI is instructed to use only the supplied scores and context.
- The AI must distinguish observations from assumptions and identify evidence gaps when context is insufficient.
- The AI returns structured findings rather than unrestricted narrative output.
- The response separates strengths, material risks or gaps, recommended next actions, evidence references, confidence, and review status.
- The review includes model metadata, a review identifier, a prompt version, and a timestamp for traceability.

Human-in-the-loop control

AI status	Meaning
Generated	The AI has produced a structured review that has not yet been validated by a human.
Needs evidence	A reviewer believes the observation or recommendation requires supporting documentation or stakeholder confirmation.
Accepted	A qualified reviewer has considered the finding and agrees it is suitable for the working assessment record.
Overridden	A reviewer has rejected or materially revised the AI observation or recommendation.

CONTROL BOUNDARY

AI findings never silently modify the underlying dimension scores. Any accepted action remains a reviewed recommendation, not an automated determination of legal, regulatory, security, or operational status.

8. Governance, limitations, and responsible use

Evidence and confidentiality

- Users are instructed to provide non-sensitive summary context only.
- They should not enter privileged client information, credentials, personal data, secrets, or confidential matter details into the free-text context field.
- A production deployment should define retention, access control, deletion, logging, and data residency requirements before use with sensitive organizational information.

Interpretive limitations

- A self-assessment is a representation of reported conditions, not independent verification.
- A high score does not prove compliance, security, resilience, or effectiveness.
- A low score is a prompt for investigation and prioritization, not a definitive statement of failure.
- The assessment does not replace a formal audit, penetration test, legal review, risk assessment, control testing, or professional advice.

Enterprise implementation controls

- Server-side schema validation for domains, score ranges, context length, and reviewer actions.
- No client-side model credentials and no direct browser-to-provider calls.
- Rate limiting, timeout handling, retry behavior, and partial-failure visibility before production scale-up.
- Role-based access control for reviewer actions and append-only audit records for material decisions.
- Versioning of the assessment content, scoring rules, prompts, model metadata, and generated findings.
- Accessibility review, secure development review, and documented change management for releases.

9. Originality and authorship description

The protectable expression in the work includes the original selection, coordination, arrangement, wording, and presentation of the assessment domains, cross-cutting dimensions, maturity-level descriptions, scoring explanations, workflow sequence, result interpretation, and AI-assisted review experience as implemented in the software and accompanying materials.

The underlying concepts of maturity assessment, risk management, service management, cybersecurity, continuity, data governance, and human review are general subject matter and may be informed by established professional practice. This description does not claim ownership of those general concepts. It describes the particular expression and integrated arrangement created for this assessment instrument.

Work components

- Domain taxonomy and domain descriptions tailored to legal IT operations.
- Five-dimension assessment matrix applied consistently across domains.
- Five-level maturity language and level-specific examples.
- Score aggregation rules, thresholds, labels, and roadmap interpretation.
- Guided assessment workflow, result views, and explanatory user interface.
- AI-assisted review contract, evidence-bound prompt behavior, structured findings, confidence, metadata, and human validation states.
- Visual design system, report composition, and presentation of the methodology and results.

Recommended filing attachments

- Representative screenshots or screen captures of the assessment flow and results.
- Source-code deposit or appropriate software deposit materials, if required by the filing route.
- The generated walkthrough and methodology PDFs as representative accompanying materials.
- A dated version record identifying the release submitted for registration.

FILING NOTE

Confirm deposit format, authorship, claimant, publication status, and required identifying material with the relevant copyright-office instructions or qualified counsel. This document is a technical description, not filing advice.
